

EtherCAT®

for Bayard-Alpert Pirani Capacitance Diaphragm Gauge

BCG450-SE

EtherCAT®

General Information

Caution

! Caution: data transmission errors

Any attempt to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface or the diagnostic port may result in incorrect data and data transmission errors.

Therefore, it is inadmissible to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface, or the diagnostic port.

Intended Use

This Communication Protocol contains instructions for operating EtherCAT interfaces (slaves) together with a master.

For safety information, specifications and operation instructions of the vacuum gauges refer to the appropriate documents (→ [1], [2], [3]).

EtherCAT-Interface

The following description of the EtherCAT® interface is compliant to the EtherCAT specification of the EtherCAT Technology Group (ETG) and to the "EtherCAT® Semiconductor Device Profile".

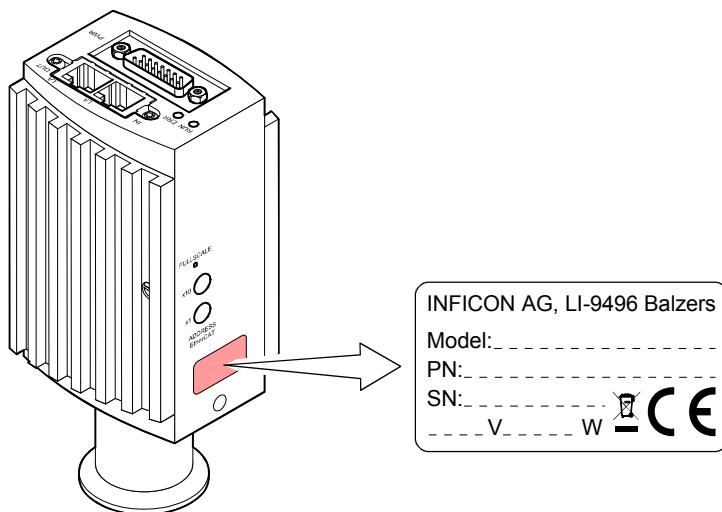

This manual describes the functionality of a EtherCAT slave and supports

- ETG.5003.1 S (R) V1.0.0 : Part 1 Common Device Profile (CDP) (→ [12]) and
- ETG.5003.2080 S (R) V1.0.0 : Part 2080: Specific Device Profile (SDP): Vacuum Pressure Gauge (→ [13]).

We reserve the right to make technical changes without prior notice.

Product Identification

In all communications with INFICON, please specify the information on the product nameplate. For convenient reference copy that information into the space provided below.

Validity

This document applies to products with part numbers

353-592 (BCG450-SE with EtherCAT, vacuum connection DN 25 ISO-KF)
353-593 (BCG450-SE with EtherCAT, vacuum connection DN 40 CF-R)

This manual is based on firmware version 1.2.0.0.

If your unit does not work as described in this document, please check that it is equipped with the above firmware version (→  12 Index: 0x100A Subindex: 0x00).

The part number (PN) can be taken from the product nameplate.

If not indicated otherwise in the legends, the illustrations in this document correspond to the gauge BCG450-SE with vacuum connection DN 25 ISO-KF. They apply to gauges with other vacuum connections by analogy.

We reserve the right to make technical changes without prior notice.

1 Technical Data

Further technical data → [1], [2], [3].

EtherCAT interface	Communication protocol	protocol specialized for EtherCAT
	Communication standards	ETG.5003.1: Part 1 Common Device Profile (CDP) ETG.5003.2080: Part 2080 Specific Device Profile (SDP): Vacuum Pressure Gauge
	Data rate	100 Mbps
	Node address	Explicit Device Identification
	Physical layer	100BASE-Tx (IEEE 802.3)
	Digital functions	read pressure, select units (Torr, mbar, Pa) emission control, degas function monitor gauge status, filament status safe state allows definition of behavior in case of error
	Analog functions	0 ... 10 V analog output pressure indication two setpoint relays A + B
	Setpoint relays	2
	Range	$1 \times 10^{-9} \dots 100$ mbar
	Relay contact	n.o. potential free
	Hysteresis	10 % of reading
	Contact rating	≤ 30 V / ≤ 0.5 A (dc)
	EtherCAT connector	2 × RJ45, 8-pin (socket) <IN>: EtherCAT input <OUT> EtherCAT output
Cable		shielded, special Ethernet Patch Cable (CAT5e quality or higher)
Cable length		≤ 100 m
Process data		Fixed PDO mapping and configurable PDO mapping
Mailbox (CoE)		SDO requests, responses and information

Dimensions [mm]

2 Interface Connection

Making an EtherCAT interface cable

For operating the BCG450-SE gauge via EtherCAT, two interface cables conforming to the EtherCAT standard are required.

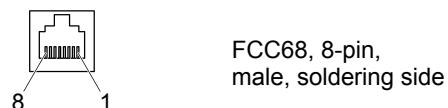

If no such cables are available, make two according to the following indications.

Cable type

Ethernet Patch Cable (CAT5e quality) with FCC68 connector.

Procedure

1 Pin assignment:

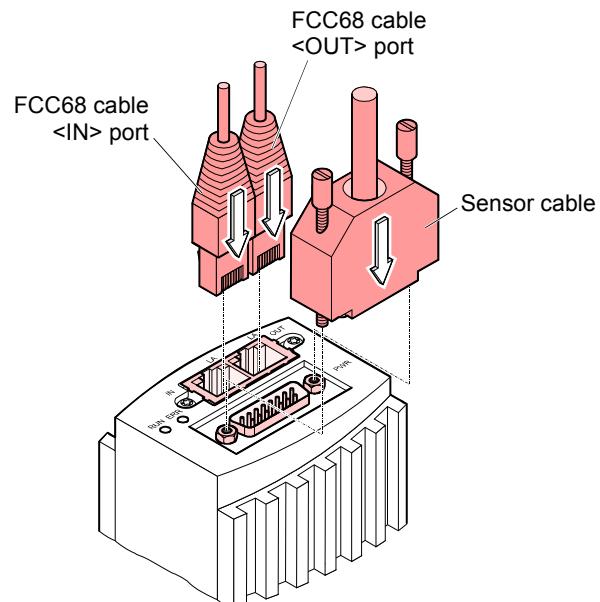

Pin	Signal	Description
1	TD+	Transmission Data +
2	TD-	Transmission Data -
3	RD+	Receive Data +
4	nu	not used
5	nu	not used
6	RD-	Receive Data -
7	nu	not used
8	nu	not used

Pin assignment of the D-Sub 15-pin sensor connector according to the respective operating manual (→ [1], [2], [3]).

2

Plug the EtherCAT (and sensor) cables connector into the gauge: From the previous device the cable connected to OUT port has to be connected to the BCG450-SE <IN> port. And the cable from the BCG450-SE <OUT> port has to be connected to the next device's <IN> port.

3 Operation

3.1 Introduction

Via the EtherCAT interface, the following and further data are exchanged in the standardized EtherCAT protocol:

- Pressure reading
- Pressure unit (Torr, mbar, Pa)
- Status and error messages
- Status of the switching functions
- Set Trip Point for switching functions

Caution

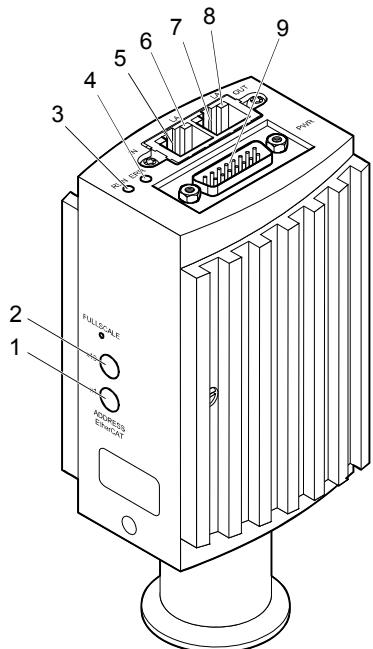

Caution: data transmission errors

Any attempt to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface or the diagnostic port may result in incorrect data and data transmission errors.

Therefore, it is inadmissible to simultaneously operate the gauge via the RS232C Serial Interface and EtherCAT interface or the diagnostic port.

3.2 Front View

Position	Label	Function
1	x1	Address Switch × 1, hexadecimal
2	x10	Address Switch × 10, hexadecimal
3	RUN	EtherCAT Status LED
4	ERR	Error LED
5	IN	EtherCAT IN connector
6	LA	Link activity EtherCAT IN
7	OUT	EtherCAT OUT connector
8	LA	Link activity EtherCAT OUT
9	PWR	Sensor cable connector (Power, analog I/O, RS232C I/O and Relay contacts)

3.3 Indicators and Switches

3.3.1 <RUN> LED

Displays the operating status.

Color	LED State	Description
green	off	INIT (initialization status) or no power applied to device.
	blinking (200 ms on 200 ms off)	PREOP (pre-operational status).
	single flash (200 ms on 1000 ms off)	SAFEOP (safe-operational status). Communication of cyclic data transfer running. Input values available, output values written to the device but not updated on device output.
	on	OP (operational status).

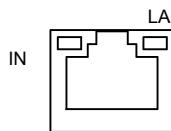

3.3.2 <ERR> LED

Displays the error content.

Color	LED State	Description
red	off	No error or no power applied to device.
	blinking (200 ms on 200 ms off)	Error occurred (see error parameter).
	single flash (200 ms on 1000 ms off)	Slave device application has changed the EtherCAT state autonomously, due to local error (see error parameter).
	double flash (200 ms on 200 ms off 200 ms on 1000 ms off)	An application watchdog timeout has occurred. Sync Manager Watchdog timeout or communication timeout occurred.
	on	A critical communication or application controller error has occurred. Application controller is not responding any more (PDI Watchdog Timeout detected by ESC)

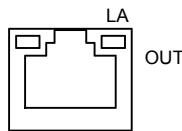

3.3.3 <LA> LED (<IN> Port)

Displays the input status.

Color	LED State	Description
green	off	Port not connected or no power applied to device.
	blinking	Port connected and communication active.
	on	Port not connected but no communication.

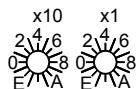

3.3.4 <LA> LED (<OUT> Port)

Displays the output status.

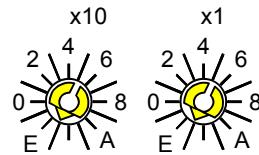

Color	LED State	Description
green	off	Port not connected or no power applied to device.
	blinking	Port connected and communication active.
	on	Port not connected but no communication.

3.3.5 Device Address Switch

During device initialization, the device address switches are read by the device firmware. This device address is supported to the master as Explicit Device Identification.

Example: Value of the Explicit Device ID = 0xDD (dec 221):
 $0x10 * 0xD$ (dec 208) + $0x1 * 0xD$ (dec 13)

4 Object Structure

This chapter describes the CANopen over EtherCAT (CoE) Object Dictionary.

4.1 Object Dictionary structure

The objects in the CoE Object Dictionary can be accessed with SDO services, and many of the dictionary objects can be mapped for cyclic communication in PDOs. Each object is addressed using a 16-bit index and an 8-bit subindex.

The following table presents the overall layout of the standard Object Dictionary.

Index (hex.)	Object dictionary area	
1000 – 1FFF	Communication profile area	
2000 – 5FFF	Manufacturer-specific profile area	
6000 – 6FFF	Profile Specific Area	Input area
7000 – 7FFF		Output area
8000 – 8FFF		Configuration area
9000 – 9FFF		Information area
A000 – AFFF		Diagnosis area
B000 – BFFF		Service Transfer area
C000 – EFFF		Reserved area
F000 – FFFF		Device area

Explanations for the abbreviations in the columns of the tables are given below:

Abbr.	Description
Access	SDO read/write access <ul style="list-style-type: none"> • RO: object can only be read by the SDO service • RW: object can be both read and written by the SDO service
CoE	CAN application protocol over EtherCAT
Index	Object Index (hex.) (address of an object)
NV	Nonvolatile; attribute value is maintained through power cycles
Object	Abstract representation of a particular component within a device, which consists of data, parameters, and methods.
PDO	Process Data Object. Structure described by mapping parameters containing one or several process data entities.
PM	PDO mapping <ul style="list-style-type: none"> • Rx: object can be mapped into an Rx PDO • Tx : object can be mapped into a Tx PDO
RxPDO	Receive PDO. A Process Data Object received by an EtherCAT slave.
SDO	Service Data Objects. CoE asynchronous mailbox communications where all objects in the Object Dictionary can be read and written.
SI	Subindex (hex.) (sub-address of an object)
Type	Data Type <ul style="list-style-type: none"> • BOOL, BIT = 1 bit. Boolean (0 = false, 1 = true) • USINT, BYTE = 8 bit. Unsigned Byte • UINT = 16 bit. Unsigned integer value • UDINT = 32 bit. Unsigned integer value • ULINT = 64 bit. Unsigned integer value • REAL = 32 bit. Floating point • V_STRING = 8×n bit. Visible string (1 byte for character)
TxPDO	Transmit PDO. A Process Data Object sent from an EtherCAT slave.

4.2 Communication Profile Objects (0x1000...0x1FFF)

The objects of the communication profile describe the basic EtherCAT properties of the BCG450-SE and are common to all EtherCAT slaves using the CoE communication protocol. The objects are described in following table:

Index	SI	DataType	NV	Access	PM	Name
1000		UDINT		RO		Device Type
1008		V_STRING		RO		Manufacturer Device name
1009		V_STRING		RO		Manufacturer Hardware Version
100A		V_STRING		RO		Manufacturer Software Version
1010	0x01	UDINT		RW		Store Parameters Read: Bit 0 = 1: slave saves the backup entries when writing 0x1010:01 with 0x65766173 Bit 1-31 = 0 Write: With the value 0x65766173 the backup entries will be stored to non-volatile memory of the slave
1011	0x01	UDINT		RW		Restore Default Parameters Read: Bit 0 = 1: slave supports the restoring of backup entries with the default values when writing 0x1011:01 with 0x64616F6C Bit 1-31 = 0 Write: With the value 0x64616F6C the backup entries will be restored with the default values
1018				RO		Identity Object
	0x01	UDINT		RO		Vendor ID
	0x02	UDINT		RO		Product Code
	0x03	UDINT		RO		Revision Number
	0x04	UDINT		RO		Serial Number
10F8		ULINT		RO		Timestamp Object

4.2.1 Process Data Objects (PDO's)

The BCG450 consists of three vacuum pressure sensors. The characteristic of this combo device is that only one vacuum pressure sensor outputs an actual pressure value at one time. The other sensor is in overrange condition which means that the pressure is higher than the measurement range of the sensor or underrange condition which means that the pressure is lower than the measurement of the sensor. The 'Combination Gauge Active Value' outputs the pressure value from the active measuring sensor.

For each sensor module a default mapping is configured. The mapping for each sensor module has the same contents. For a compact cyclic data frame duplicated mappings can be deactivated.

Or to meet other requirements the TxPDO's 1A01, 1A03, 1A05 or 1A07 and the RxPDO 1601 are designated for user mapping. These PDO's do not have default values and can be set up by the PDO configuration.

RxPDO's

Index	SI	DataType	NV	Access	PM	Name
1600		PM		RW		RxPDO Receive PDO Mapping,
1601		PM		RW		RxPDO Receive PDO Mapping, User Mapping

Emission current in millamps

4.5.2 Configuration Trip Point 1

If High Trip Source Index is 0x60101100

The High Trip Point is calculated by:

$$\text{High Trip Point Limit} = \text{Value}^*) \times \text{Percentage}^{**})$$

*) Value from Piezo Sensor (I: 0x6010, SI: 0x11)

**) Percentage High Trip Source (I: 0x800E/F, SI: 0x13)

In this case, the High Trip Point Limit value is automatically updated by the device itself. Any user-written value to the parameter High Trip Point Limit will be refused with an abort code.

If High Trip Source Index is 0x800E1100 or 0x800F1100 the High Trip Point is equal with the value referenced in High Trip Point Limit.

The value defined in High Trip Point Limit is compared with the pressure value referenced by the Source Index parameter.

If Low Trip Source Index is 0x60101100

The Low Trip Point is calculated by:

$$\text{Low Trip Point Limit} = \text{Value}^*) \times \text{Percentage}^{**})$$

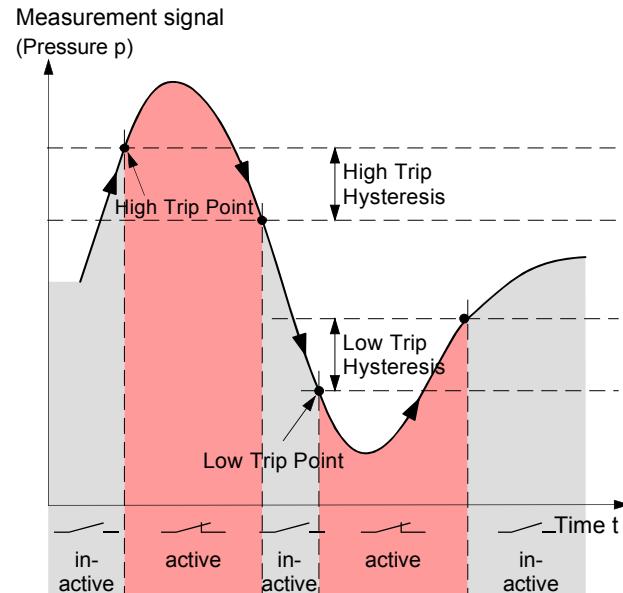

*) Value from Piezo Sensor (I: 0x6010, SI: 0x11)

**) Percentage Low Trip Source (I: 0x800E/F, SI: 0x16)

In this case, the Low Trip Point Limit value is automatically updated by the device itself. Any user-written value to the parameter Low Trip Point Limit will be refused with an abort code.

If Low Trip Source Index is 0x800E1400 or 0x800F1400 the Low Trip Point is equal with the value referenced in Low Trip Point Limit.

The value defined in Low Trip Point Limit is compared with the pressure value referenced by the Source Index parameter.

4.6 Information Area (0x9000...0xFFFF)

The Information Data object defines the input process data.

Highest / lowest measurement value

The "measurement range" is the range between minimum and maximum pressure, where the reading of the gauge is within the specified measurement uncertainty limits.

The "valid measurement information range" (display range) is the complete pressure range where the gauge gives an indication (measurement signal). The valid measurement information range (display range) consists of underrange, measurement range and overrange.

According to these definitions, 4 points are defined:

- 1 Lowest informational measurement value
- 2 Lowest precision measurement value
- 3 Highest precision measurement value
- 4 Highest informational measurement value

Index	SI	DataType	NV	Access	PM	Name
9000	0x02	REAL	x	RO		Highest Informational Measurement Value Module 1
	0x03	REAL	x	RO		Highest Precision Measurement Value Module 1
	0x04	REAL	x	RO		Lowest Precision Measurement Value Module 1
	0x05	REAL	x	RO		Lowest Informational Measurement Value Module 1

Subindex 0x02

Highest Informational Measurement Value: Highest value that the gauge can measure without a specified accuracy.

Subindex 0x03

Highest Precision Measurement Value: Highest valid value at which the gauge is specified with an accuracy value. Above that value, the parameter Reading Valid is set to invalid.

Subindex 0x04

Lowest Precision Measurement Value: Lowest valid value at which the gauge is specified with an accuracy value. Below that value, the parameter Reading Valid is set to invalid.

Subindex 0x05

Lowest value the gauge can measure without a specified accuracy.

4.6.1 Information Capacitance Diaphragm

Index	SI	DataType	NV	Access	PM	Name

4.7.11 Comination Gauge

Index	SI	DataType	NV	Access	PM	Name
F640	0x01	BOOL		RO	tx	Combination Gauge Reading Valid
	0x02	BOOL		RO	tx	Combination Gauge Overrange Exceeded
	0x03	BOOL		RO	tx	Combination Gauge Underrange Exceeded
	0x11	REAL		RO	tx	Combination Gauge Active Value
	0x12	UINT		RO	tx	Combination Gauge Active Sensor Number

Subindex 0x01

Identifies whether the complete vacuum pressure gauge (with several measuring principles) is out of its absolute overrange or absolute underrange, or in any other failure condition.

Subindex 0x02

If the bit "Overrange" is set, all modules of the gauge are in an overrange condition.

Subindex 0x03

If the bit "Underrange" is set, all modules of the gauge are in an underrange condition

Subindex 0x11

The value copied from the measurement value of the active measuring module used for the Input PDO.

Subindex 0x12

Identifies the module that is providing the measurement value, the latter of which is copied into the Active Value parameter for all Input PDO's.

0	No module has a valid value
1	Capacitance diaphragm sensor is providing the Active Value
2	Piezo sensor is providing the Active Value
3	Heat Transfer sensor is providing the Active Value
4	Hot Cathode sensor is providing the Active Value

	0x04	UDINT		RO	tx	Input Latch Local Timestamp module 4

Subindex 0x01

Local controller time corresponding to the input latch time in microseconds. It starts at zero on device power-up. Mandatory if device has inputs. If device has no inputs defined, this corresponds the time immediately prior to writing to input SM.

Subindex 0x02

Local controller time corresponding to the input latch time in microseconds. It starts at zero on device power-up. Mandatory if device has inputs. If device has no inputs defined, this corresponds the time immediately prior to writing to input SM.

Subindex 0x03

Local controller time corresponding to the input latch time in microseconds. It starts at zero on device power-up. Mandatory if device has inputs. If device has no inputs defined, this corresponds the time immediately prior to writing to input SM.

Subindex 0x04

Local controller time corresponding to the input latch time in microseconds. It starts at zero on device power-up. Mandatory if device has inputs. If device has no inputs defined, this corresponds the time immediately prior to writing to input SM.

4.7.14 Configure Device

Index	SI	DataType	NV	Access	PM	Name
F840	0x01	UDINT	x	RW		Data Units
	0x02	V_STRING		RW		Password

Subindex 0x01

Unit of the Value of the Analog Input Sensor Instance and all related parameters.

Trip Point Output All Instance	
0x00220000	Pascal
0xFD4E0000	mbar
0x00A10000	Torr
0x00E00000	Counts (INFICON)

Subindex 0x02

Writing the corresponding password (vendor specified value) enables Access Rights (Index F940 Subindex 03)

4.7.15 Information Device

Index	SI	DataType	NV	Access	PM	Name
F940	0x01	UDINT		RO		Measurement Principle
	0x02	BYTE		RO		Number of Sensors
	0x03	USINT		RO		Access Rights
	0x04	V_STRING	x	RO		SW Version VPG PCB
F9F0		V_STRING		RO		Manufacturer Serial Number
F9F1	0x01	UDINT		RO		CDP Functional Generation Number Module 1
	0x02			RO		CDP Functional Generation Number Module 2
	0x03			RO		CDP Functional Generation Number Module 3
	0x04			RO		CDP Functional Generation Number Module 4
F9F2	0x01	UDINT		RO		SDP Functional Generation Number Module 1
	0x02	UDINT		RO		SDP Functional Generation Number Module 2
	0x03	UDINT		RO		SDP Functional Generation Number Module 3
	0x04	UDINT		RO		SDP Functional Generation Number Module 4
F9F3		V_STRING		RO		Vendor Name
F9F4	0x01	V_STRING		RO		Semiconductor SDP Device Name Module 1
	0x02	V_STRING		RO		Semiconductor SDP Device Name Module 2
	0x03	V_STRING		RO		Semiconductor SDP Device Name Module 3
	0x04	V_STRING		RO		Semiconductor SDP Device Name Module 4
F9F5	0x01	USINT		RW	rx tx	Output Identifier Module 1
	0x02	USINT		RW	rx tx	Output Identifier Module 2
	0x03	USINT		RW	rx tx	Output Identifier Module 3
	0x04	USINT		RW	rx tx	Output Identifier Module 4
F9F6		UDINT		RO		Time since power on
F9F7		UDINT	x	RO		Total time powered
F9F8		UDINT		RO		Firmware Update Functional Generation Number

Subindex 0x01 (F940)

Measurement principle assigned to the object instance.

The most significant nibble of the parameter represents the sensor type of the first Module, the second most significant nibble of the parameter represents the sensor type of the second Module, and so forth.

Measurement Principle (Index F940)	
1	Capacitance Manometer
2	Piezo
3	Heat Transfer
4	Cold Cathode
5	Hot Cathode

Subindex 0x02 (F940)

Number of Sensors (Index F940): In this device are 4 sensors implemented.

Subindex 0x03 (F940)

Access Rights (Index F940)	
0	User access to measurement and limited diagnostic features
1	Service access to additional diagnostic features (vendor specific)
2	Superuser access to vendor-specific parameters and features, e.g. calibration parameters, model number, serial numbers

Subindex 0x04 (F940)

Software version of the basic device.

4.7.16 Command Full Scale Adjust

Execution of this command will start a Full Scale Adjust operation.

Index	SI	DataType	NV	Access	PM	Name
FB41	0x01	V_STRING		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(3)		RO		Response

Subindex 0x01

A full scale adjust command is initiated when the following byte sequence is sent.

Command	
Byte 0	0: Full Scale Adjust
Byte 1	Index of the Sensor Module. Value has to be 1 1: Capacitance Diaphragm
Byte 2...5	Full Scale value (Data format: REAL). Value has to be 0

Subindex 0x02

Status (supported values)	
0	Last command completed, no errors, no reply available
1	Last command completed, no errors, reply available
2	Last command completed, errors present, no reply available
3	Last command completed, errors present, reply available
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02
Byte 1	Unused
Byte 2	0: Full Scale Adjust successful 1: Full Scale Adjust failed: out-of-range 254: No previous Full Scale Adjust command issued

4.7.17 Command Degas ON / OFF

Execution of this command will initiate or cancel a degas operation.

Index	SI	DataType	NV	Access	PM	Name
FB43	0x01	V_STRING(2)		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(3)		RO		Response

Subindex 0x01

A degas command is initiated when the following byte sequence is sent.

Command	
Byte 0	0: Degas OFF 1: Degas ON
Byte 1	Index of the sensor module. Value has to be 4 4: Hot Cathode

Subindex 0x02

Status (supported values)	
0	Last command completed, no errors, no reply available
1	Last command completed, no errors, reply available
2	Last command completed, errors present, no reply available
3	Last command completed, errors present, reply available
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02
Byte 1	Unused
Byte 2	0: Degas ON / OFF successful 1: Degas ON / OFF failed (unspecified reason) 2: Degas On failed because pressure to high 254: No previous Degas ON / OFF command issued

4.7.18 Command Emission ON / OFF

Execution of this command will turn on or off the gauge's emission state.

Index	SI	DataType	NV	Access	PM	Name
FB44	0x01	V_STRING(2)		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(3)		RO		Response

Subindex 0x01

An emission command is initiated when the following byte sequence is sent.

Command	
Byte 0	0: Emission OFF 1: Emission ON
Byte 1	Index of the sensor module. Value has to be 4 4: Hot Cathod

Subindex 0x02

Status (supported values)	
0	Last command completed, no errors, no reply available
1	Last command completed, no errors, reply available
2	Last command completed, errors present, no reply available
3	Last command completed, errors present, reply available
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02
Byte 1	Unused
Byte 2	0: Emission ON / OFF successful 1: Emission ON / OFF failed (unspecified reason) 2: Emission On failed because pressure too high 254: No previous Emission ON / OFF command issued

4.7.19 Device Reset Command

Execution of this command causes the device to emulate a complete power cycle. This includes an ESC reset. An SDP may limit some behavior of the power cycle emulation, but shall not exclude the EtherCAT interface.

As consequence of an ESC reset all following devices are disconnected from the network.

There are two versions of this command:

- Standard reset (as described above)
- Factory reset (as described above, but additionally, all parameters are restored to as-shipped defaults).

Index	SI	DataType	NV	Access	PM	Name
FBF0	0x01	V_STRING(6)		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(1)		RO		Response

Subindex 0x01

A device reset is initiated when the following byte sequence is sent.

Command	
Byte 0	0x74
Byte 1	0x65
Byte 2	0x73
Byte 3	0x65
Byte 4	0x72
Byte 5	0x00 = Standard reset, 0x66 = Factory Reset

Subindex 0x02

Status (supported values)	
0	Reserved
1	Reserved
2	Last command completed, error, no response
3	Reserved
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02

4.7.20 Exception Reset Command

Execution of this command clears the latched exceptions.

Index	SI	DataType	NV	Access	PM	Name
FBF1	0x01	V_STRING(5)		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(1)		RO		Response

Subindex 0x01

A exception reset is initiated when the following byte sequence is sent.

Command	
Byte 0	0x74
Byte 1	0x65
Byte 2	0x73
Byte 3	0x65
Byte 4	0x72

Subindex 0x02

Status (supported values)	
0	Last command completed, no error, no response
1	Reserved
2	Last command completed, error, no response
3	Reserved
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02

4.7.21 Store Parameters Command

Execution of this command will store all parameters to non-volatile memory. If a device automatically saves all non-volatile parameters at the time they are set, this command will not take any action.

Index	SI	DataType	NV	Access	PM	Name
FBF2	0x01	V_STRING(4)		RW		Command
	0x02	BYTE		RO		Status
	0x03	V_STRING(1)		RO		Response

Subindex 0x01

A device reset is initiated when the following byte sequence is sent.

Command	
Byte 0	0x65
Byte 1	0x76
Byte 2	0x61
Byte 3	0x73

Subindex 0x02

Status (supported values)	
0	Last command completed, no error, no response
1	Reserved
2	Last command completed, error, no response
3	Reserved
255	Command is executing

Subindex 0x03

Response	
Byte 0	See Subindex 0x02
